

## DEFENSE REIMAGINED

There's no getting around it: cyber attackers are growing increasingly sophisticated in their tactics. From web apps and operating systems to hardware and human error, today's hackers leave no potential vulnerability unchecked. But that's why you have antivirus, right? Not so fast.

If recent headlines have taught us anything, it's this: A determined hacker can bypass even the most robust security program. So what should an organization do? The answer is simple: a defense in depth strategy.

## Defense in Depth

Developed by former NSA cyberwarfare operators, our program of managed detection and response represents a new layer in the security stack. Combining automated collection tools with expert analysis, our team actively hunts down threats that may have slipped past other layers of protection. A recent analysis uncovered a foothold based on Windows' Trusted Applications that has gone unaddressed for years.

Designed to complement your existing security stack, our program of managed detection and response allows you to address those gaps, stopping advanced persistent threats and 0-day malware in their tracks. This defense-in-depth model reduces time to detection and provides more comprehensive protection for your organization's IT assets.
